

School and University Lighting:

Learning in the Best Environment

Safety and security on campus are the top priorities of the administration. Switching to LED lighting will keep energy and maintenance costs down while improving the outdoor environment. In classrooms, LED can help relieve glare issues and dark spots that create challenges for students being able to see lectures and take notes.

Superior Lighting: If you switch to a LED fixture that is made for schools and educational venues, you will experience an enhanced lighting environment.

Savings: You can reduce your lighting energy usage and costs as much as 80%. Along with this, maintenance costs will go down substantially, saving you thousands annually.

Long-Term Investment: Many LED light fixtures last up to 100,000 hours, which is longer than 10 years of typical usage.
